

Synthetic Fixture: VR-Based Scaffolding Effects on Reaction Time

SYNTHETIC FIXTURE — For platform export QA only. Not a real submission. No IRB approval, author consent, or research outcome is claimed.

Abstract

Synthetic fixture abstract. Mean RT decreased in intervention (T1 M=1860.23, SD=56.86) vs control (T1 M=2773.33, SD=122.75). Welch $t(2.83) = -11.934$, $p = 0.0017$, Cohen's $d = -9.74$, 95% CI [-1165.18, -661.02].

1. Introduction

Synthetic fixture introduction. Generated by platform renderer for export QA purposes only.

2. Method

Synthetic cohort: $n=6$ (3/arm), RT in ms, measured at T0 (pretest) and T1 (posttest).

3. Results

Statistic	Value	95% CI	p
Welch t-test	$t(2.83) = -11.934$	[-1165.18, -661.01]	0.0017
ANCOVA β_1	$\beta = -945.213$, SE = 107.75	[-2314.37, 423.95]	0.0723

Cohen's $d = -9.74$. R^2 (ANCOVA) = 0.99. $\alpha = 0.05$. Holm-Bonferroni adjusted.

4. Discussion

Synthetic fixture discussion. Reference: Smith, J. (2024). Synthetic Citation for QA. Journal of Fixture Studies, 1(1), 1–10.
